# How long does mercury last

## Overview

---

A day on Mercury lasts 59 Earth days. Mercury has been known since ancient times because it can be seen without advanced telescopes. Discover what Mercury Retrograde means for communication. Inorganic mercury, or metallic mercury, has a relatively short half-life in the brain compared to methylmercury. Understanding the. But how long does Mercury Retrograde actually last?

And what's the deal with the pre-shadow and post-shadow periods that astrologers keep talking about?

To truly understand the timing and effects of Mercury Retrograde, it helps to look beyond the official retrograde dates and consider the full. This small planet spins around slowly compared to Earth, so one day lasts a long time. It takes 59 Earth days to make one day (or one full rotation) on Mercury. However, a year on Mercury goes by fast! Because it's the closest planet to the Sun, it doesn't take very long to go all the way around. This means there are three weeks of things slowing down (pre-shadow), three weeks of the actual retrograde, and three weeks of getting things back up to speed (post-shadow).
