# **Kabul reduced carbon emissions**

## Overview

---

Kabul has developed a comprehensive climate action plan that outlines strategies and goals for reducing emissions and adapting to climate change. This plan recognizes the importance of carbon offset programs as a key tool in achieving these objectives. These programs allow individuals and organizations to invest in projects that reduce or remove greenhouse gas emissions, effectively offsetting their own. Afghanistan is currently regarded among the ten countries most vulnerable to climate change, which is expected to adversely impact its environment, economy and population. According to climate change experts, the country's annual average temperatures are expected to be 1.9°C higher by the end of the century. In Badakhshan, Afghanistan, tree plantation helps stabilise a dangerous slope and creates a natural carbon sink to help tackle the climate crisis. Today, the city is home to over 4 million people.
