## Overview

---

Panama's electricity consumption in 2023 shows a commendable reliance on low-carbon sources, with more than half of its electricity—approximately 62%—coming from these clean alternatives. Hydropower emerges as the most significant source, contributing nearly 48% of the total. Renewables are an increasingly important source of energy as countries seek to reduce their CO2 emissions and dependence on imported fossil fuels. Renewables are mainly used to generate electricity, though renewable technologies can also be used for heating in homes and buildings. According to the press release, an exportable surplus of 226.47 MW was produced to supply the deficit of other. The Electric Generation Company (EGESA) has received approval from its Board of Directors for the construction of a new 5 Megawatt (MW) solar plant, a key step in the progress towards a more sustainable energy model for Panama. This transition is driven by changes in consumer behaviour, the incorporation of modern and less polluting fuels, the reduction of electricity generation based on liquid fossil fuels in favour of natural gas and non-conventional renewable technologies, the development of electric. Panama's government is implementing a long-term power sector roadmap through 2050, including clean-energy auctions, regulatory upgrades and nationwide electrification efforts. Panama will reactivate national energy planning with a new long-term strategy that will take effect in 2026 and include.

## Panama city renewable electricity
