

# Photovoltaic panel back sheet defects

## Overview

---

To protect the module, consider three defective factors: adhesion, mechanical strength, and weather-resistance ability. A photovoltaic (PV) module, commonly known as a solar panel, is composed of multiple layers. One critical layer is the backsheet [1], which protects the internal components from environmental contamination. Failure of the backsheet allows humid air to enter the module, resulting in water. The long-term stability of photovoltaic modules is key to the continuous production of electricity from a photovoltaic system. Its deterioration may result in lower efficiency and general problems with power generation.

Solar panel

backsheets protect PV modules from environmental damage and work as electrical insulation. If a backsheet is defective or ineffective, a solar panel will encounter severe damage. When a backsheet fails, the entire module fails to function properly as well. Common problems that one might encounter are unacceptable power degradation, terr See more on werecycle solar vishakharenewables
