## Overview

---

Microgrids manage their own power generation and consumption, improving reliability, integrating renewable energy, and providing power during main grid outages. A microgrid is a group of interconnected loads and distributed energy resources within clearly defined electrical boundaries that acts as a single controllable entity with respect to the grid. This not only helps to mitigate greenhouse gas emissions and reduce the impact of. A microgrid, in short, is a localized energy system that can operate independently or in connection with the main electric grid. These resources can include solar panels, wind turbines, fuel cells, microturbines, diesel generators, and sometimes combined heat and power (CHP) systems. Coalition stakeholders include the City of Oakridge, South Willamette Solutions, Lane County, Oakridge Westfir Area Chamber of Commerce, Good Company/Parametrix, Oakridge Trails.
